vmdk file along with an introduction file in case you want to read it. Enjoy! Manual Update Click on the.vmdk file and select use the system files for manual installation. This will start the installation. Wait till its done. Booting Click on Boot Game and select System Boot Select the.vmdk file which you downloaded. Make sure it is highlighted in green color and click on OK This is the Windows XP version, booting XP just as expected. You will be asked for your password, type it in and press enter You will be asked to choose the install device, select SATA. Since you are going to have to update the kernel inside the VM, we have to go to the VM and update the kernel in the VM. As a side note, the main things I do in the VMs are, in order of frequency: 1) Start the machine with SATA disk 2) Connect the USB keyboard and mouse (and remove anything else) 3) Start the VM, then boot to the disk that has the file located on it. (Usually Windows XP) 4) Select the.vmdk file, usually in the list of disks (it changes as you make changes). 5) Wait for a bit and you will notice that a new partition is being created (this usually takes a few minutes). 6) Click the Install button and the files will begin to download. 7) Wait and when done, click the Finish button. 8) Click OK and wait. This will take a few minutes for the device to be recognized and assigned to you. 9) The files will begin to install. 10) Once complete, click the Restart button. 11) The machine should start up and you should see the Windows XP Loader screen. Click OK. 12) The file update should be completed. When it is, you can boot to Windows XP normally. (If it was not completed, then you will not see the Blue Screen and your machine will still be stuck in Windows XP) Most of the time, you only see the Windows XP loader screen but not the Linux one. The reason for this is that the Linux kernel update is in a separate file from the main VMWare installation. You can go to the VM to the console by pressing Ctrl+Alt+F2 82157476af
